

Reflection Log for Quadratic Formula

How did you approach understanding the challenge?

I did the necessary bits first, like declarations and Scanner setup. The thing about declarations that was different was that the quadratic formula has a negative and, at the same time, a positive, which made me realize there would be two roots (I knew this, but I realized I would have to put it in code)

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I'm not new to the Quadratic Formula; we have touched on it a bit in math, so I wasn't that confused. I knew there would be two roots.

Did you create a plan or break the problem into smaller steps before coding?

I broke the code into smaller chunks. I do that consistently now

How did you decide on the tools, data structures, or algorithms to use?

I could continue using int for a, b, and c; however, I would need to use double for the roots, as they can involve decimals. I would continue to use Scanner like everything else.

Did you write the code in small pieces or attempt the entire solution at once?

I broke the code into smaller pieces instead of attempting it all at once, it is good practice.

How did you test your solution along the way to make sure it was working?

Every couple of lines, I kept testing it to see if it would work. And if i moved on to a different stage of the code i tested it

What part of the problem was the most difficult for you?

Writing the quadratic formula in code.

How did you handle moments when you felt stuck or unsure of what to do next?

Asked AI or searched if it was just a small question.

Was there anything you learned that you think will help you with future challenges?

I am getting a lot of practice in writing formulas in Java. Maybe it will help me with future challenges.
