

Reflection Log for Pizza Cost

How did you approach understanding the challenge?

I immediately knew that the value of the cents would change as the code progressed, and we still use Scanner from older projects, as we still need input from the user. I also knew that there would be variables like quarters and dimes, and I knew they would work with cents, and that would be how cents kept changing.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I did not know how I was gonna connect the cents with the quarter and how I could take one user input and be able to change the number to show quarters, nickels, and dimes. To me, the idea of only showing Quarters made sense; however, showing all was confusing, as it was multiple numbers.

Did you create a plan or break the problem into smaller steps before coding?

I broke the problem into smaller steps and just kept going forward from one objective to another until I was done. This is different compared to last time because last time I had done the whole plan in my head.

How did you decide on the tools, data structures, or algorithms to use?

I had Scanner like previously; today I had to use the new symbol (%) for retrieving the remainder of the number. I think I used it in Python last year, but I do not remember fully.

Did you write the code in small pieces or attempt the entire solution at once?

I wrote the code in smaller pieces this time; this is more ideal, as you can figure out issues before they ruin the whole code.

How did you test your solution along the way to make sure it was working?

I did a couple of lines and ran it to see if any errors occurred, and none did. So I consider it a success.

What part of the problem was the most difficult for you?

Figuring out how to get the remainder and move one value across quarters nickels dimes and finally pennies. When I used AI, I figured out how to do it (in ErrorLog)

How did you handle moments when you felt stuck or unsure of what to do next?

Like I previously said, I used AI to ask for help, but not to do it for me. I do think I would not have figured it out without AI; I had totally forgotten how to get the remainder and how to use it.

Was there anything you learned that you think will help you with future challenges?

If anything involving remainders comes up again, I do know what to do now. However, from the past lesson, I did implement what I wanted to do better before.
