

Reflection Log for Pizza Cost

How did you approach understanding the challenge?

One thing I realized off the bat is that the same library we used for the skillbuilder was needed. The library, of course: Scanner. This library is used to read and write input from the user. One thing I also realized is that we are using the same format as the GradeAvgP1, except we are adding the costs of materials, labor, and rent; we are not averaging it. However, the Labor costs and rent costs are already defined, so the only thing the user needs to enter is the diameter. And the code can use the formula to find the cost of production.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

The hardest part for me is always reading. When I first read the pizza example, my mind just assumes it is going to be super hard. However, when i slowly read it i realized the similarities between the example and the skillbuilders i was able to mentally think of plan of how to approach it

Did you create a plan or break the problem into smaller steps before coding?

I always mentally theorize the whole plan in my head, I already knew I had to pre-establish the Labor Cost and Rent Cost as they were already given in the Textbook. Then I realized that I had to use the format "double" and could not use the format "int" as the Labor Cost and Rent cost had decimals.

How did you decide on the tools, data structures, or algorithms to use?

As I previously said, I had to use the library scanner so that the code could be read and the user could write the diameter of the pizza. I also had to use 'double' instead of int as I was dealing with decimal numbers.

Did you write the code in small pieces or attempt the entire solution at once?

I usually write all the code at once and if there's any errors I fix it starting from the first line. I understand this isn't ideal as depending on the error a lot of the code may have to be rewritten but that is usually how I do it.

How did you test your solution along the way to make sure it was working?

This is one thing i need to work on because i do have an overconfidence based on prior code so i believe i can write it all at once and run it, yes the code did run successfully (despite the formatting error that i will explain later)

What part of the problem was the most difficult for you?

When i printed it the pizza cost for a 12 inch diameter it always printed \$8.950000001
I knew I had to change something in the print line but I did not know what.

How did you handle moments when you felt stuck or unsure of what to do next?

I asked AI to save time because I was not even aware of the printf() function in Java. I thought it was print() or println() only.

Was there anything you learned that you think will help you with future challenges?

I need to test run the code every couple of lines so I am sure there are no errors when I finish the code, because that would be a nightmare, and I would have wasted a bunch of time.
