

What error message did you encounter (if any)?

I didn't encounter an error; however, my code didn't behave the way I wanted it to.

What unexpected behavior did your program exhibit?

The Total Cost of the Pizza had too many decimal places and was not formatted correctly.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

I used `println()` to print the pizza's total cost, but that's the wrong print function.

Include a screenshot of specific lines of code.

```
// Output Cost
```

```
System.out.println("The Cost of making the Pizza is: $" + cost);|
```

How did you fix the issue?

I changed `println()` to `printf()`, and i added `%.2f%n` to format the number correctly

Correct lines of code screenshot

```
// Output Cost
```

```
System.out.printf("The Cost of making the Pizza is: $%.2f%n", cost);
```
