2. A method declaration shows Java how to use the method. A body shows what is actually done.

3. The keyword is called an access modifier, which is the type of keyword used.

4. Another word used is visibility or scope.

5. Method1 is the entire scope with 4 variables.

6a.
```
public class Vowel {

        public static String getVowels(String text, int count) {
            String vowels = "";

         return vowels;
    }
}
```

6b.
```
public class Digit {

    public static int extractDigit(int number) {

        int digit = 0;

        return digit;
    }
}
```

6c.
```
public class StringUtility {

    public static String insertString(String text, int position) {

        String result = "";

        return result;
```

```
    }
}
```

7a. Using the method signature, a compiler can differentiate between two different methods
7b. No, as a compiler cannot differentiate between the two of them.
7c.

8a. Stops the execution of the methods and sends the final value of the code back.
8b. Only 1 value.
8c. It does not mark the final code, so it is not marked as complete.

9. I believe the issue is that the return value should have been in the main code, not just doSomething()

11. a) true
    b) false
    c)false
    d)false
    e)true
    f) false
    g) false
    h) true
    I)false
    j)true
    k) false
    i) false
