Reflection Log for Perfect Integers

How did you approach understanding the challenge?
I already had experience with these methods, and I knew what a perfect integer was, which led me to do this. However, for my skill level, this code was harder.
Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?
It is very hard for me sometimes to figure out what exactly has to go into the for loop, and yeah. Things like “<=”, for example, I had no idea about.

Did you create a plan or break the problem into smaller steps before coding?
I broke the code into smaller chunks. I do that consistently now
How did you decide on the tools, data structures, or algorithms to use?
I knew I had to use methods because Chapter 6 explicitly mentioned the names in the textbook exercise. I also originally thought that I had to use the math function, but I did not have to in that context.

Did you write the code in small pieces or attempt the entire solution at once?
I broke the code into smaller pieces instead of attempting it all at once; it is good practice.

How did you test your solution along the way to make sure it was working?
Every couple of lines, I kept testing it to see if it would work. And if I moved on to a different stage of the code, I tested it
---

What part of the problem was the most difficult for you?
Setting up the methods for isPerfect()

How did you handle moments when you felt stuck or unsure of what to do next?
Asked AI or searched if it was just a small question.

Was there anything you learned that you think will help you with future challenges?
Extra practice on methods; it should help me with future challenges.
