

Reflection Log for Investment

How did you approach understanding the challenge?

I chose investment because I realized the code idea was pretty similar to CarPayments (well, variable-wise). I realized Scanner wasn't needed because the variable was already filled in.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I was wondering how the loop would work; however, I realized we have to use the while loop because we know the target of \$5000. We just need to figure out the number of years.

Did you create a plan or break the problem into smaller steps before coding?

I broke the problem into smaller steps. This is routine with me now.

How did you decide on the tools, data structures, or algorithms to use?

I knew I would have to use double for principal, target and interest rate as they can be decimals. However, for years I still used int because it represents a whole integer. I used while instead of for because I do know the target, just not how many years it takes to get there.

Did you write the code in small pieces or attempt the entire solution at once?

I wrote the code in smaller pieces

How did you test your solution along the way to make sure it was working?

I kept running every couple of lines or when I changed the stage of the code

What part of the problem was the most difficult for you?

The while loop; however, it is pretty straightforward to understand. I was confused on the years++; portion it was new to me.

How did you handle moments when you felt stuck or unsure of what to do next?

I kept trying, and if it did not get better, I asked peers. If they did not know, I searched it.

Was there anything you learned that you think will help you with future challenges?

The while loop can definitely help me with future challenges.
